

Lesson 2 Smart Phone APP Control

1. Preparation

After calibrating position of camera, turn on the switch on the Raspberry Pi expansion board. It usually takes about 1 minute to boot up from the time it is Powered ON. Open the APP “WonderPi” to connect the Wi-Fi hotspot named with the first letters “HW”.

2. Have a Try

1) Click ArmPi to come into the interface.

2) There are different games for your choice. For example, when you click ArmPi Model Remote Control, all the servos on the ArmPi will come to the middle position.

3) Buttons on the left sides are used to control the servos on the hand, wrist and bottom. The right side of the interface is a two-dimensional animation. You

can drag the robotic arm model to control easily. Click

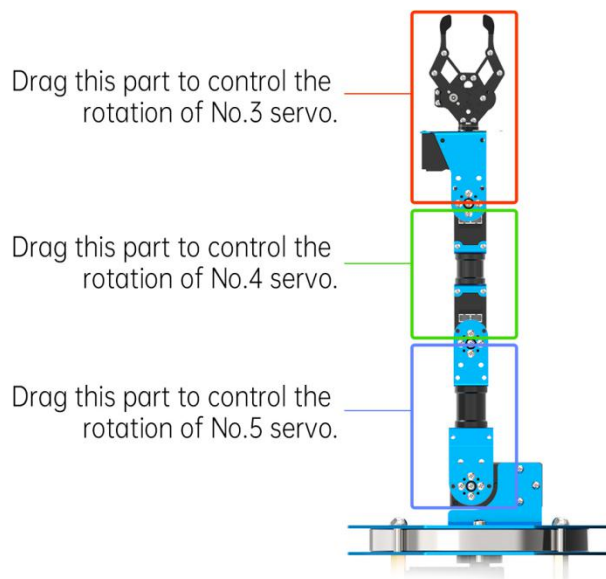

to

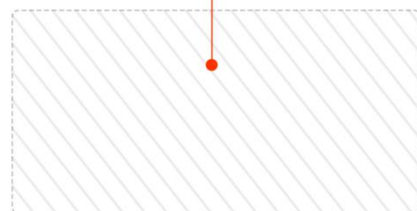

call the ArmPi to initial shape.

4) Click “INSTRUCTIONS” to check more operated details.

This is the anti-touch area of the robotic arm to limit the rotation of servos.

i When this game is activated, the ArmPi robotic arm will automatically face upwards.

5) If you want to back to the “Mode Selection”, please click  button.

No.	Game	Outcome
1	Color Tracking	After identification, ArmPi will track the color block and then pick up to the corresponding sorting area after the block stopping for 1.5 seconds.
2	Color Sorting	Place the color blocks in the recognition area. ArmPi will sort one by one. (Block with largest recognition color area will be picked up first)
3	Intelligent Stacking	Place the color blocks in the recognition area. ArmPi will find the location and stack them in the setting area.
